

Hospital Outcomes Scoring (HOS) Database

Providing consumers access to hospital death & complications information.

Peter A. Wadsworth
www.AmoryAssociates.com

“A study by researchers at Johns Hopkins Medicine says medical errors should rank as the third leading cause of death in the United States...” NPR.org May 3, 2016

“Death is the most important hospital outcome to avoid.”

WHAT ARE HOSPITAL OUTCOMES SCORES (HOS)?

“Death is the most important hospital outcome to avoid.”

The Centers for Medicare & Medicaid Services (CMS) compile hospital outcomes data for:

- 7 Causes of Deaths with reported rates as high as 21.2% of discharges
- 10 Types of Complications with rates as high as 2.3% of discharges

Each rate is scaled to yield hospital scores from 0% to 100% and medians of 50%.

Scaled rates for each hospital are then averaged to yield a Death Score and a Complication Score:

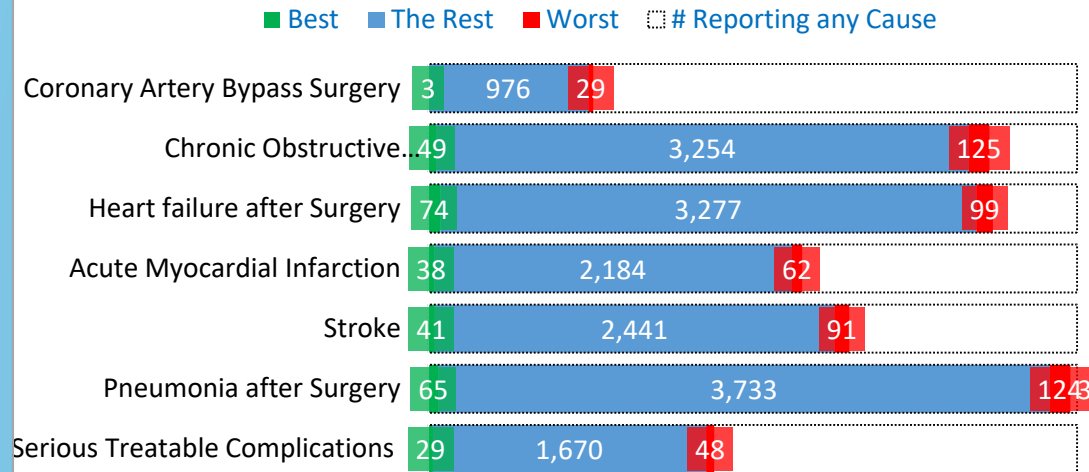

- Average death rate (Death Score) based on up to 7 reported death rates.
- Average complication rate (Complication Score) based on up to 9* reported rates.

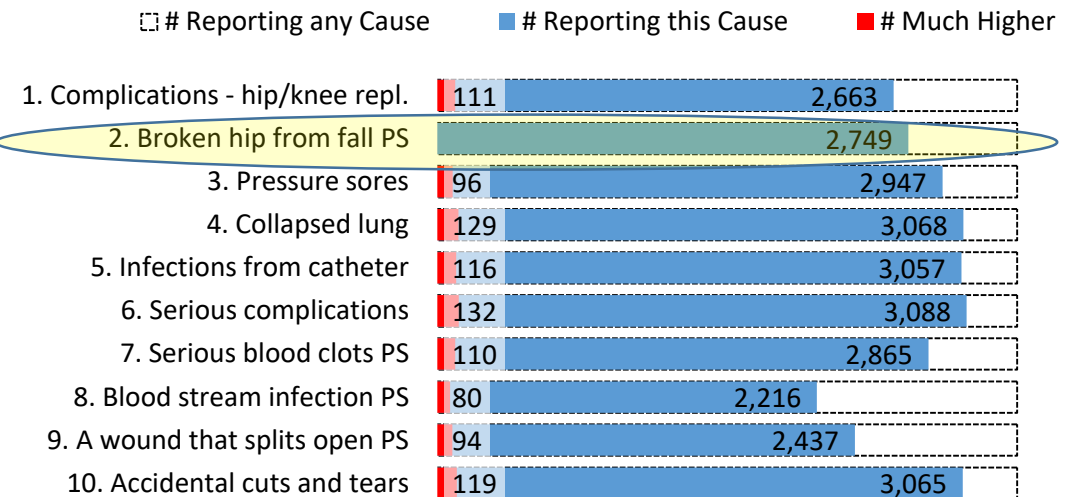

**One complication rate is excluded for reasons explained later.*

3,382 U.S. Hospitals reported at least one Death Rate and one Complication Rate

Hospitals Reporting Death Rates

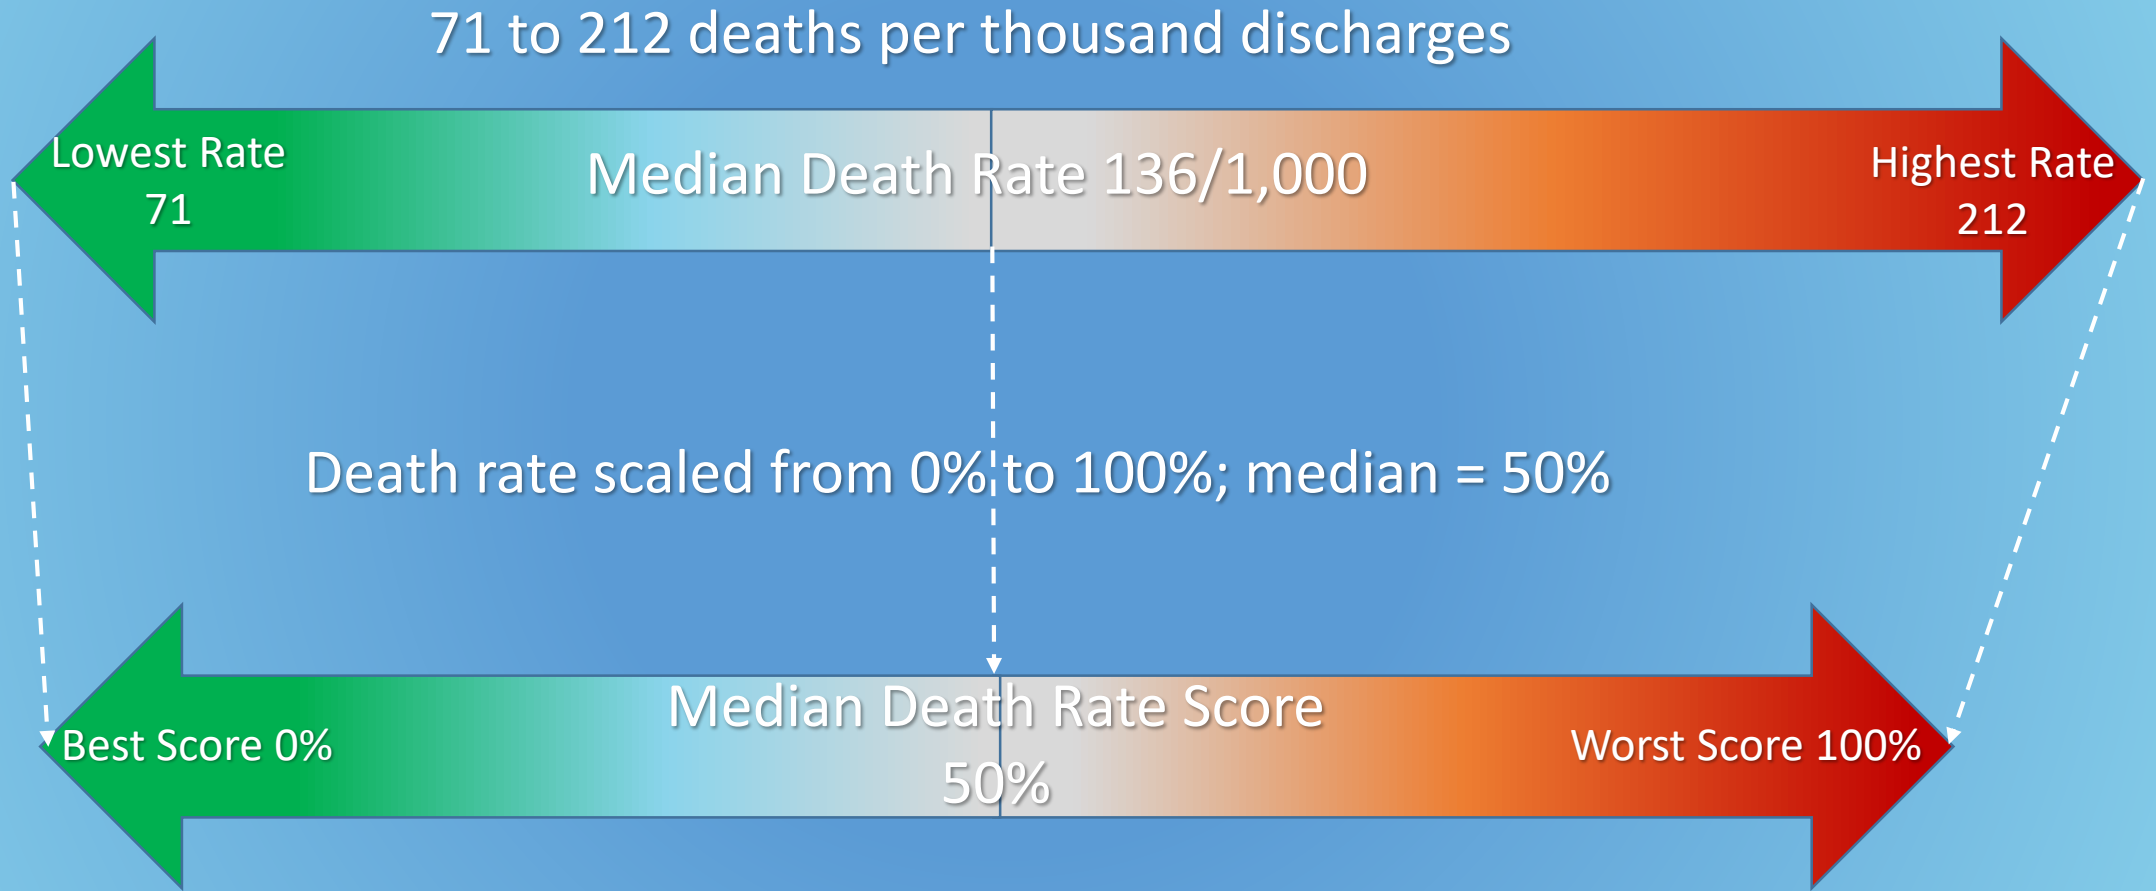

Hospitals Reporting Complications

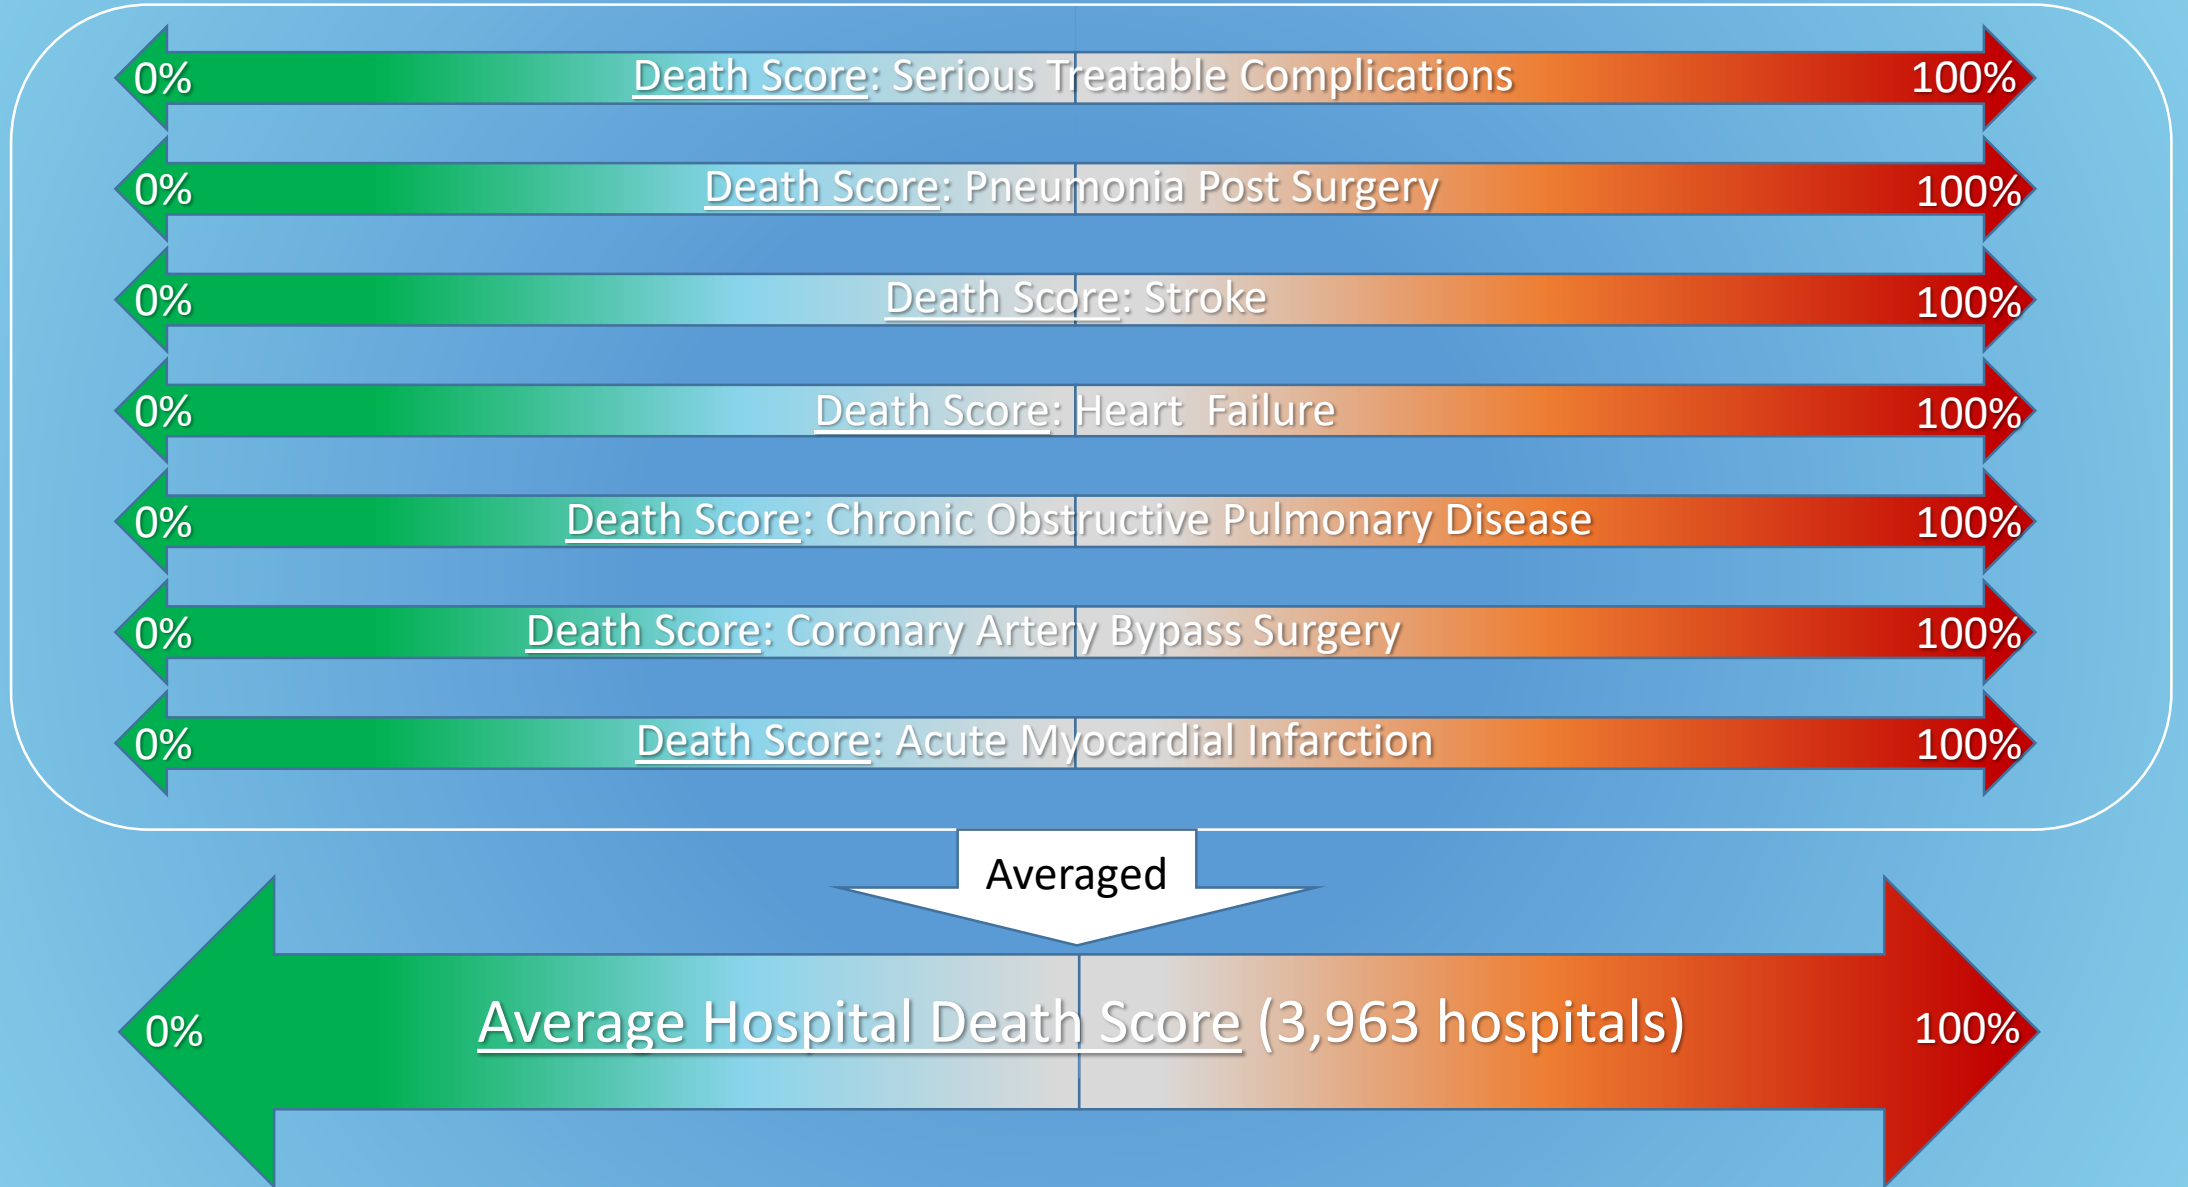

excluded from Complication Scores because all hospitals reported the same rate.

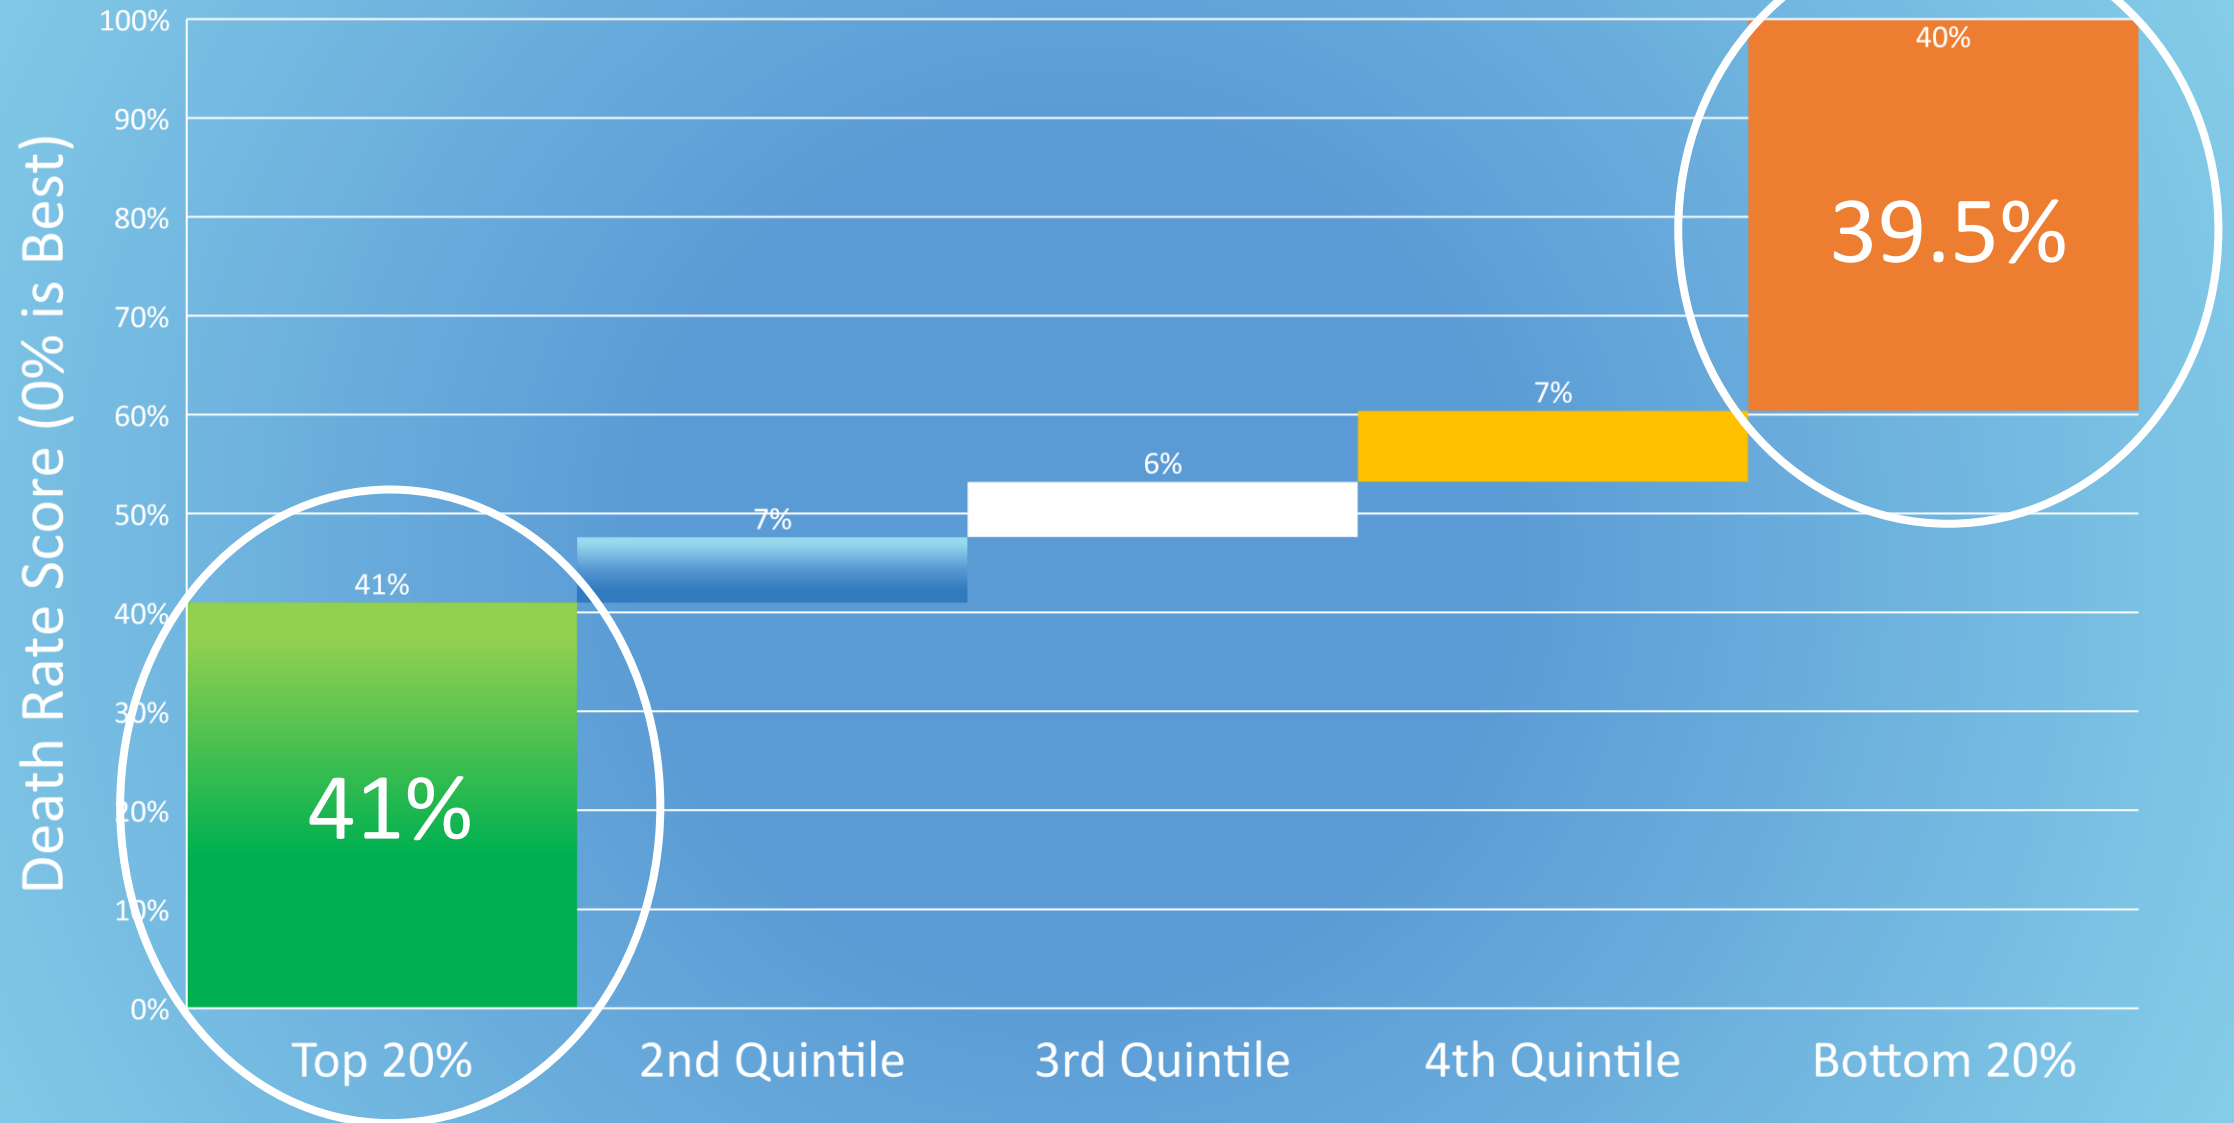

Example: Death rates due to Serious Treatable Complications

Hospital Death Score = average of all 7 Death Rate Scores

The top and bottom 20% of hospitals account for 80% of the variation in HOS Death Scores.

WHY DO WE NEED HOSPITAL OUTCOMES SCORES (HOS)?

“Death is the most important hospital outcome to avoid.”

Hospital Outcomes Scores (HOS) offer certain advantages over other ratings systems:

1. **Zero in on** the most objective measures of safety - **outcomes**.
2. **Rank hospitals by Death Score then by Complications Score**.
3. **Don't dilute outcomes** by combining them with non-outcome factors.
4. Other hospital **safety ratings don't predict death rates** very well.
5. **Median Scores of 50%** make it easier to tell which hospitals are better.
6. **Scores from 0% to 50%** differentiate more effectively than 123 or ABC .

Accordingly, we think that HOS should be seen by consumers alongside other safety ratings.

Death Rate Scores may lead consumers to make different choices than Medicare Ratings & Hospital Safety Grades

10 Lowest Hospital Death Rate Scores in NY & MA	ST	Death Rate Score	Compl-ication Score	Medicare Rating (5=best)	Medicare Safety Score* (1=best)	Hosp. Safety Grade
Specialty Hospital	NY	5.8%	38.6%	5	1	NR
Teaching Hospital	NY	9.7%	50.7%	4	1	C
Teaching Hospital	NY	13.0%	40.5%	4	4	C
Community Hospital	MA	13.4%	58.0%	3	5	B
Community Hospital	NY	16.9%	44.1%	2	1	D
Community Hospital	NY	16.9%	48.5%	4	3	A
Community Hospital	MA	20.1%	45.1%	3	1	A
Teaching Hospital	MA	21.6%	45.5%	4	1	A
Community Hospital	MA	21.9%	42.0%	4	1	NR
Community Hospital	MA	22.8%	54.6%	3	3	B
Teaching Hospital	MA	22.8%	53.7%	3	5	A
Teaching Hospital	NY	22.9%	55.1%	3	3	C

* Medicare Safety Scores based on Number of Years and most recent year of Safety Penalties assessed by Medicare.

HOS Power BI Database Model

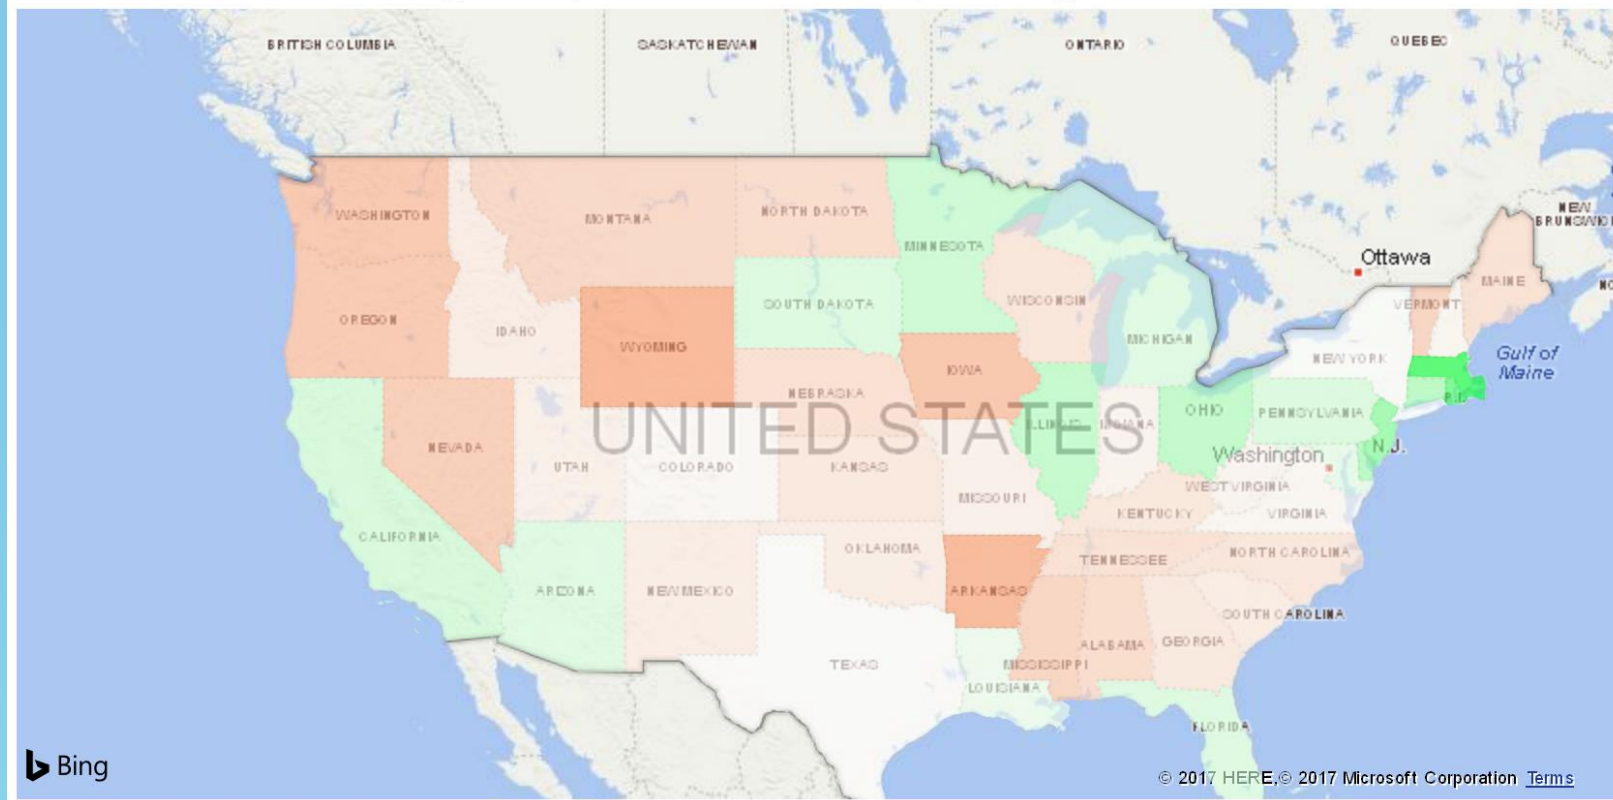

Amory Associates has created a
Power BI (©Microsoft) Database Model
as illustrated on the following slides
to provide quick access to
HOS Scores anywhere in the U. S.

All U.S. Hospitals reporting Death & Complication Scores

Average Hospital Death Rates by State (green is best)

Careful Selection of Hospitals can Substantially Reduce Mortality Risk

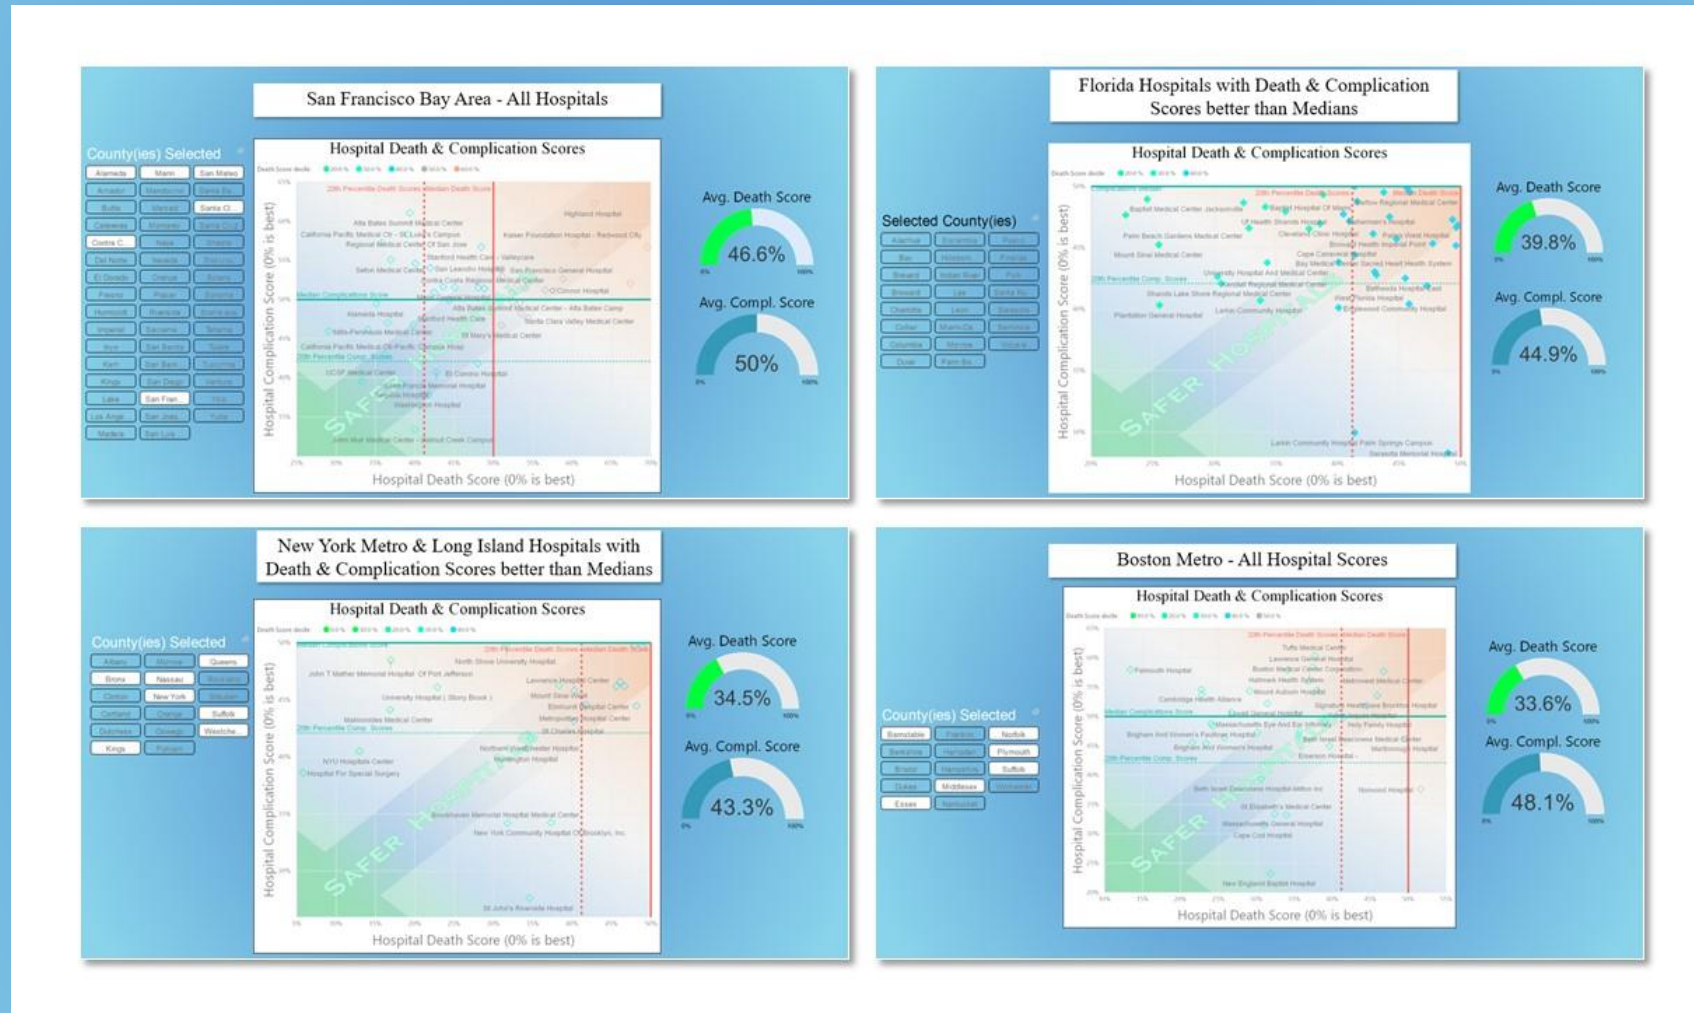

Impact of Selecting Hospitals by Death/Complications Scores

However, selecting hospitals by limiting the Complication Score Has little impact on the Death Score, and vice versa . . .

Four geographic areas illustrate the local capabilities of the HOS Power BI Model.

41 Bay Area Hospitals have an average Death Score of 46.6%.

County(ies) Selected
